List PWS ID #s for all Community Water Systems included in this CCR

The Federal Safe Drinking Water Act (SDWA) requires each Community public water system to develop and distribute a Consumer Confidence Report (CCR) to its customers each year. Depending on the population served by the public water system, this CCR must be mailed or delivered to the customers, published in a newspaper of local circulation, or provided to the customers upon request. Make sure you follow the proper procedures when distributing the CCR. You must mail, fax or email a copy of the CCR and Certification to MSDH. Please check all boxes that apply.

Customers upon request. Make sure you follow the proper procedures when distributing the CCR. You must mail, fax or email a copy of the CCR and Certification to MSDH. Please check all boxes that apply.

Customers were informed of availability of CCR by: (Attach copy of publication, water bill or other)

Advertisement in local paper (attach copy of advertisement)

On water bills (attach copy of bill)

Email message (MUST Email the message to the address below)

Other

Date(s) customers were informed: (I) / / / / / / / /

CERTIFICATION

I hereby certify that the 2013 Consumer Confidence Report (CCR) has been distributed to the customers of this public water system in the form and manner identified above and that I used distribution methods allowed by the SDWA. I further certify that the information included in this CCR is true and correct and is consistent with the water quality monitoring data provided to the public water system officials by the Mississippi State Department of Health, Bureau of Public Water Supply.

Name/Title (President, Mayor, Owner, etc.)

06/30/2014 Date

Deliver or send via U.S. Postal Service: Bureau of Public Water Supply P.O. Box 1700 Jackson, MS 39215

May be faxed to: (601)576-7800

May be emailed to: <u>Melanie. Yanklowski@msdh.state.ms.us</u>

2013 Annual Drinking Water Quality Report Shuqualak Butler Water Association PWS#: 520024

May 2014

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water. Our water source is from wells drawing from the Massive Sand Aquifer.

The source water assessment has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identified potential sources of contamination. A report containing detailed information on how the susceptibility determinations were made has been furnished to our public water system and is available for viewing upon request. The wells for the Shuqualak Butler Water Association have received moderate susceptibility rankings to contamination.

If you have any questions about this report or concerning your water utility, please contact Narvell Colemon at 601.677.3372. We want our valued customers to be informed about their water utility. If you want to learn more, please attend any of our regularly scheduled meetings. They are held on the first Thursday of the month at 6:30 PM at City Hall.

We routinely monitor for constituents in your drinking water according to Federal and State laws. This table below lists all of the drinking water contaminants that were detected during the period of January 1st to December 31st, 2013. In cases where monitoring wasn't required in 2013, the table reflects the most recent results. As water travels over the surface of land or underground, it dissolves naturally occurring minerals and, in some cases, radioactive materials and can pick up substances or contaminants from the presence of animals or from human activity; microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm-water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming, pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm-water runoff, and residential uses; organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations and septic systems; radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some constituents. It's important to remember that the presence of these constituents does not necessarily indicate that the water poses a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) - The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary to control microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) - The level of a drinking water disinfectant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

16. Fluoride	N	2010*	.342	No Range	ppr	n	4		4 Erosion of natural deposits; water additive which promotes strong teeth; discharge from fertilizer and aluminum factories
17. Lead *	N	2009/11*	1	0	ppt	•	0	AL=	15 Corrosion of household plumbing systems, erosion of natural deposits
22. Thallium	Y	2013	2.5	No Range	ppt)	0.5		Leaching from ore-processing sites; discharge from electronics, glass, and drug factories
Disinfecti	on By-	-Products							
Chlorine	N	2013	1.2	1 – 1.8	mg/l	0	MDF	RL = 4	Water additive used to control microbes

^{*} Most recent sample. No sample required for 2013.

Inorganic Contaminants:

We routinely monitor for the presence of drinking water contaminants. Testing results we received shows that our system exceeded the standard, or maximum contaminant level for Thallium. The standard for Thallium is 0.002 mg/l. Our result is 0.0025 mg/l. We will increase the frequency that we test for thallium and work with the Mississippi State Department of Health to evaluate options to correct the problem.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Our water system is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead. The Mississippi State Department of Health Public Health Laboratory offers lead testing. Please contact 601.576.7582 if you wish to have your water tested.

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline 1-800-426-4791.

The Shuqualak Butler Water Association works around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.

⁽²³⁾ Thallium. Some people who drink water containing thallium in excess of the MCL over many years could experience hair loss, changes in their blood, or problems with their kidneys, intestines, or liver.

52/24

2013 Annual Drinking Water Quality Report Shuqualak Butler Water Association PWS#: 520024 May 2014

" " WIER SUPPLY

2011 Wrife locaged to opsess to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and scholars we delivering you were fully. Our constant goal is to provide you with a sale and dependable supply of drinking water. We want you to understand the efforts we make to continuity improve the water treatment process and protect or water resources. We are committed to ensuring the quality of your water. Our water source is from wells drawing from the Massive Sand Aquifor.

The source water assessment has been completed for our public water system to determine the overall susceptibility of its dinking water supply to identified potential sources of contamination A report containing detailed information on how the susceptibility determinations were made has been furnished to our public water system and is avaidable for viewing upon request. The welfs for the Shuqualak Butler Water Association have received moderate susceptibility rankings to contamination.

If you have any questions about this report or concerning your water utility please contact Narvell Colemon at 601.677.3372. We want our valued customers to be informed about their water using if you want to learn more please attend any of our regularly scheduled meetings They are red on the rist Thursday of the month at 3.0 PM at Cly Hall

We routinely monitor for constituents in your drinking valer according for bederal and State laws. This table below lists all of the drinking water conditions that were detected during the period of January 1º to December 31º , 2013. In cases where monitoring wasn't required in 2013, the table cellors the root recent results. As water travels over the surface of land or underground, it dissolves naturally occurring minerials in some cases, radioactive materials and can pick up substances or contaminants from the presence of animatis or from human activity: microbial confaminants in entirely accurring minerials and can pick up substances or contaminants from the presence of animatis or from human activity: microbial confaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wideling invegance contaminants and as satis and metals, which can be naturally occurring or result from urban somewater runoff, indicated or domestic vastewated discharges, of and gas production, manage, or laming, periodices and health somewater runoff, indicated or domestic vastewated discharges, of and gas production, manage of mining periodicals and health somewater and valuation organic Defendants Which have physophotical of individual processes and periodicum production, and can also come from gas stalions and septic systems, radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and managed activities. In order to ensure this table value are larger including bettled drinking water, my be reasonably expected to contain at least small amounts of some constituents. It's important to remember that the presence of these constituents does not necessarily indicate that the water posses a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these farms we've provided the following definitions:

Action Lovel - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water systems.

Maximum Contominant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety

Maximum Residual Disinfectant Level (MRDL) – The highest level of a disinfectant allowed in diriking water. There is convincing evidence that addition of a disinfectant is necessary to control microbial confaminants.

Maximum Residual Disinfectant Lavel Goal (MRDLG) - The level of a dinnking water disinfectant below which there is no know health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Parts per million (ppm) or Milligrams per liter (mgf) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.
